

Integrate with Fourth Shift ERP

We make it simple!

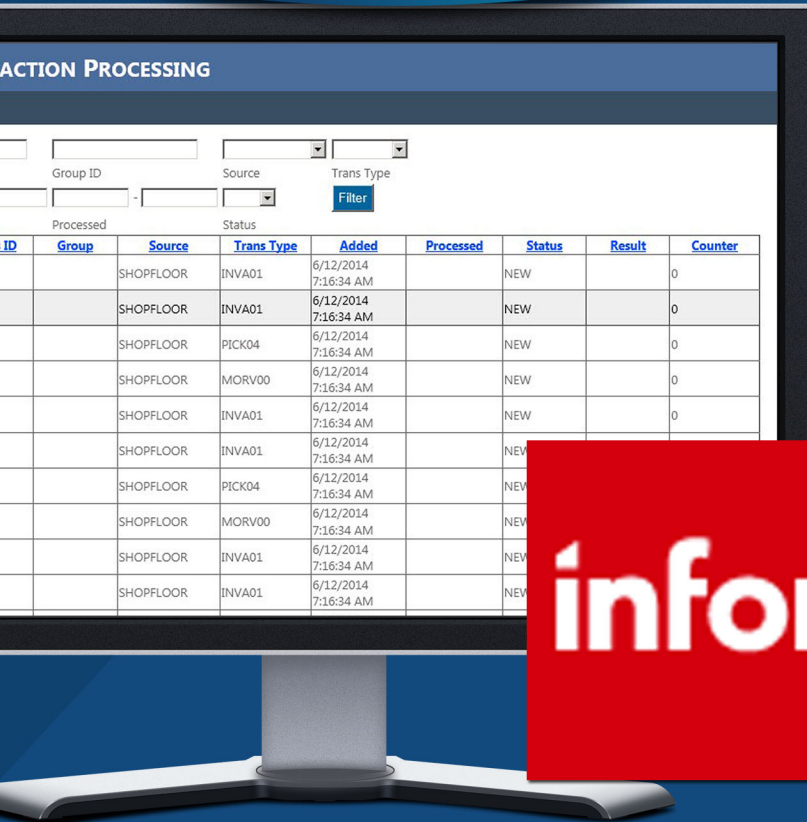

InFSTI® Connector is comprised of a web service that submits transactions to the Fourth Shift (FS) remoting service and records the results in an SQL queue table. A windows service automatically processes new transactions in the queue table and submits them to the web service for posting to FS. We provide a web based console application that provides visibility and management capabilities to the users. This application acts as a central hub for all of our integrated products. All FS transactions are also exposed as individual web services to allow direct integration with the FS remoting service via web API.

Features:

850+ FS Transactions are exposed as individual web services to the FS remoting service via web API

Automatically processes new transactions from a queue table and submits them to the web service for posting to FS

Console app that provides visibility and management capabilities to the users
